YUNET AIGNITE BUILDATHON 2026 · PROBLEM

A payment promise isn't spending money.

For students, freelancers and individual sellers, income dates change. Essential bill deadlines don't.

“Can I spend this now — and still protect my emergency reserve?”

BDT 18,000
Cash actually available

BDT 12,000
Upcoming essential bills

BDT 10,000
Expected income — not cash

BDT 8,000
Emergency reserve target

Fully synthetic example, not customer data or a survey statistic.

PROPOSED SOLUTION

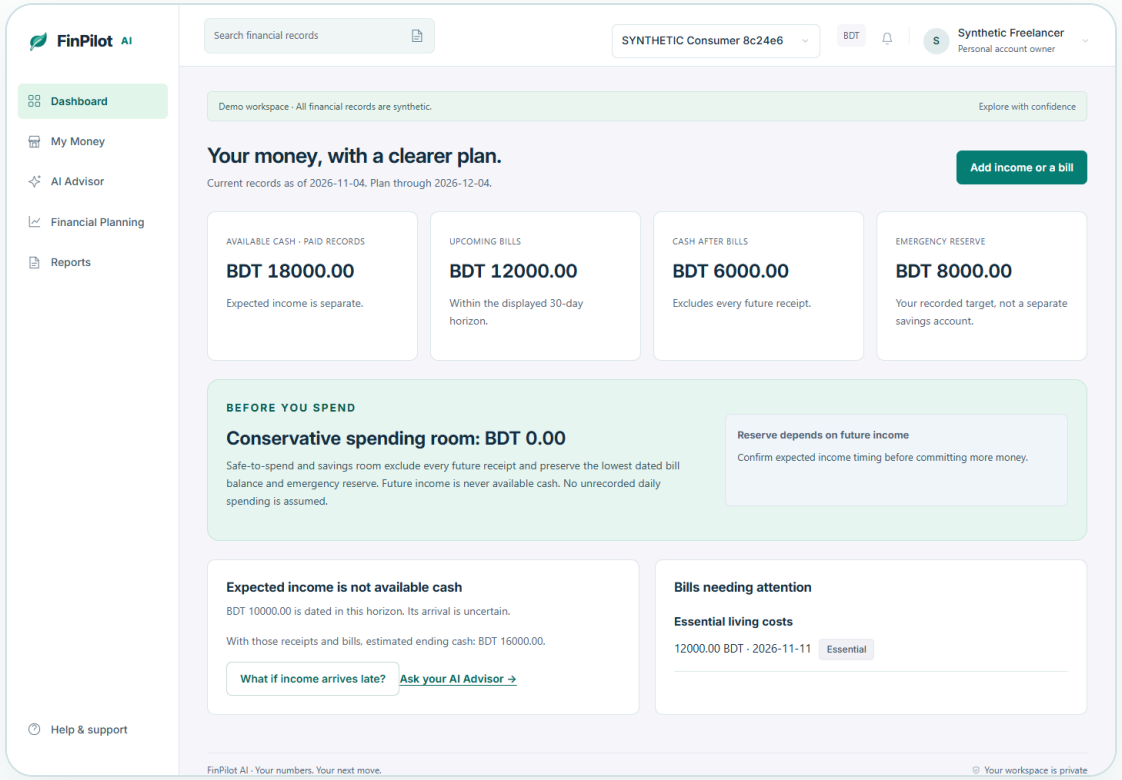

Know what is available. Plan what happens next.

Personal Mode: a short setup for cash, expected income, essential bills and your reserve.

A conservative spending buffer: future receipts are excluded until they actually arrive.

Private by workspace: personal finances and the existing Business Mode stay separate.

No bank connection required

Actual application screenshot · marked synthetic workspace

Deterministic numbers. Explainable guidance.

01 · Your records
Paid cash, dated income, essential bills and reserve.

02 · Decimal engine
Calculate timing, cash position and scenario differences.

03 · Groq Advisor
Explain the evidence with references and assumptions.

04 · You decide
Compare options. Actual money stays separate.

Django · PostgreSQL · Groq
No autonomous money movement.

“What if my freelance payment arrives seven days late?”

FinPilot response

Personal planning does not infer credit access, postpone essential bills or execute transactions. [constraint]

Assume only tx:3176 arrives 7 days later, on 2026-11-15. This is not a confirmed payment date. [F1]

Unconfirmed operational hypothesis: If the payment is delayed, the cash available for bills might be insufficient, so you could consider adjusting spending or seeking alternative liquidity. Premises [F1, F2, F5]. Check the dependency with the owner or counterparty. …

Meaningful buildathon work

Dedicated consumer onboarding and Personal Mode.

Conservative spending and savings calculations.

Four personal scenarios and consumer-grounded AI context.

Account-free, stateless synthetic demo and report export.

Existing SME calculations, authentication, Groq transport and export safeguards were reused.

INNOVATION & IMPACT

Same ending balance.
A very different week.

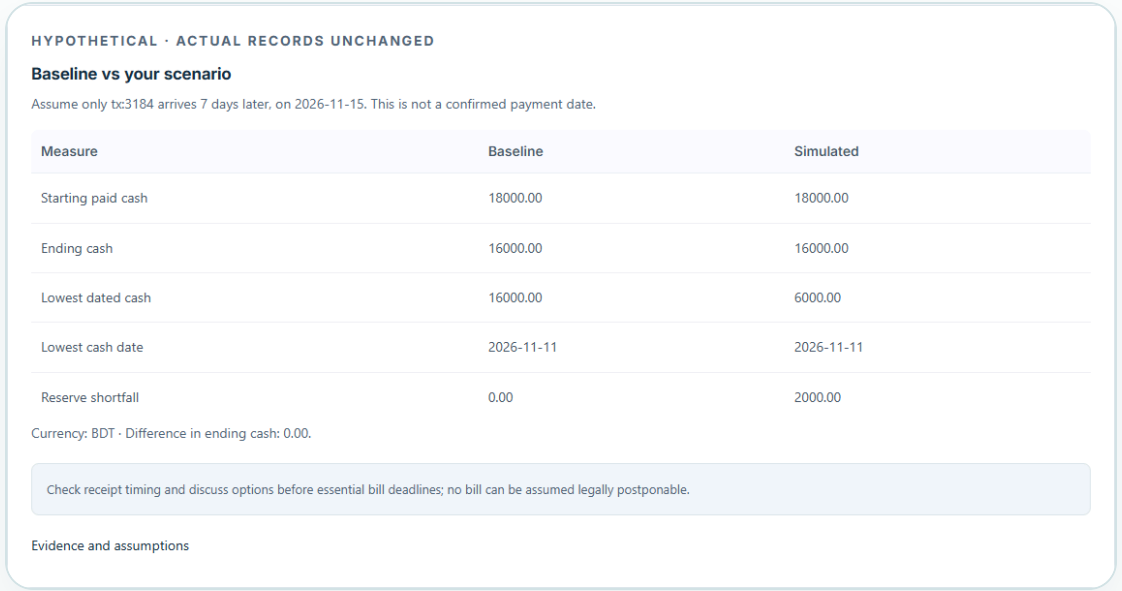

Delay the synthetic BDT 10,000 income by seven days:

BDT 16,000
Ending cash stays the same

BDT 2,000
Interim reserve shortfall appears

Timing-aware planning exposes a risk that a monthly total can miss.
Every saved scenario stays hypothetical.

HYPOTHETICAL · ACTUAL RECORDS UNCHANGED

Baseline vs your scenario

Assume only tx:3184 arrives 7 days later, on 2026-11-15. This is not a confirmed payment date.

Measure	Baseline	Simulated
Starting paid cash	18000.00	18000.00
Ending cash	16000.00	16000.00
Lowest dated cash	16000.00	6000.00
Lowest cash date	2026-11-11	2026-11-11
Reserve shortfall	0.00	2000.00

Currency: BDT · Difference in ending cash: 0.00.

Check receipt timing and discuss options before essential bill deadlines; no bill can be assumed legally postponable.

Evidence and assumptions
